Abstract—One-class support vector machines (OCSVM) have been recently applied to detect anomalies in wireless sensor networks (WSNs). Typically, OCSVM is kernelized by radial bais functions (RBF, or Gausian kernel) whereas selecting hyperparameters is based upon availability of labelled anomalous, which is rarely applicable in practice. This article investigates the application of OCSVM with data-driven hyperparameters optimization. Specifically, a kernel distance based optimization criteria is used instead of labelled data based metrics such as geometric mean accuracy (g-mean) or area under the receiver operating characteristic (AUROC). The efficiency of this method is illustrated over a real data set.

I. Introduction

II. ONE-CLASS SUPPORT VECTOR MACHINES AND **PRELIMINARIES**

In this section, we briefly recall one-class support vector machines (OCSVM) [?]. OCSVM is used to estimate the support of a distribution. Notationally, let us consider a data set $\{\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_i, \dots, \mathbf{x}_N\}$, with each $\mathbf{x}_i \in \mathcal{R}^D$ belonging to a given class of interest (named target class). The basic idea behind the OCSVM is to separate data from the origin by finding a hyperplane with maximum margin separation from the origin. In order to deal with nonlinearly problems, the hyperplane is defined in a high-dimensional Hilbert feature space $\mathcal F$ where the samples are mapped through a nonlinear transformation $\Phi(.)$. We will work only a kernel function $k(\mathbf{x}, \mathbf{y})$ instead of the scalar product $(\Phi(\mathbf{x}).\Phi(\mathbf{y}))$. To separate the data set from the origin, [1] solved the following quadratic program:

Minimize
$$\mathbf{w} \in \mathcal{F}, \mathbf{a}, \boldsymbol{\xi} \in \mathcal{R}^{N}, \rho \in \mathcal{R}$$

$$\frac{1}{2} ||\mathbf{w}||^{2} + \frac{1}{\nu N} \sum_{i=1}^{N} \xi_{i} - \rho \quad \text{(1a)}$$

$$\mathbf{Subject to } (\mathbf{w}.\Phi(\mathbf{x}_{i})) \geq \rho - \xi_{i}, \quad \xi_{i} \geq 0 \quad \text{Substituting (4), (5) and (6) into (3), and using the kernel}$$

$$\forall i_{\text{function}} \text{Tunction}, \text{we have}$$

Here, w is a vector perpendicular to the hyperplane in \mathcal{F} , and ρ is the distance to the origin. Since the training data distribution may contain outliers, a set of slack variables $\xi_i \geq$ 0 is introduced to deal with them. The parameter $\nu \in (0,1]$ controls the tradeoff between the number of examples of the training set mapped as positive by the decision function

$$f(\mathbf{z}) = \operatorname{sgn}((\mathbf{w}.\Phi(\mathbf{x})) - \rho) \tag{2}$$

and having a small value of $||\mathbf{w}||$ to control model complexity.

Using multipliers $\alpha_i, \beta_i \geq 0$, [1] introduced a Lagrangian

$$L(\mathbf{w}, \boldsymbol{\xi}, \boldsymbol{\alpha}, \boldsymbol{\beta}, \rho) = \frac{1}{2} ||\mathbf{w}||^2 + \frac{1}{\nu N} \sum_{i=1}^{N} \xi_i - \rho - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) - \sum_{i=1}^{N} \alpha_i ((\mathbf{w} \cdot \Phi(\mathbf{x}_i)) - \rho + \xi_i) -$$

and set the derivatives with respect to the primal variables w, $\boldsymbol{\xi}$, ρ equal to zero, i.e.

$$\frac{\partial L(\mathbf{w}, \boldsymbol{\xi}, \boldsymbol{\alpha}, \boldsymbol{\beta}, \rho)}{\partial \mathbf{w}} = 0: \quad \mathbf{w} = \sum_{i=1}^{N} \alpha_i \Phi(\mathbf{x}_i), \tag{4}$$

$$\frac{\partial L(R, \mathbf{a}, \boldsymbol{\xi}, \boldsymbol{\alpha}, \boldsymbol{\gamma}, \rho)}{\partial \mathcal{E}_i} = 0: \quad \alpha_i = \frac{1}{\nu N} - \beta_i \le \frac{1}{\nu N}, i = 1, \dots, \emptyset$$

$$\frac{\partial L(R, \mathbf{a}, \boldsymbol{\xi}, \boldsymbol{\alpha}, \boldsymbol{\gamma}, \rho)}{\partial \xi_i} = 0: \quad \alpha_i = \frac{1}{\nu N} - \beta_i \le \frac{1}{\nu N}, i = 1, \dots, \mathfrak{N}$$

$$\frac{\partial L(R, \mathbf{a}, \boldsymbol{\xi}, \boldsymbol{\alpha}, \boldsymbol{\gamma}, \rho)}{\partial \rho} = 0: \quad \sum_{i=1}^{N} \alpha_i = 1$$
(6)

In (4), all patterns $\{\mathbf{x}_i : i \in [1,\ldots,N], \alpha_i > 0\}$ are called Support Vectors. From (4), using the kernel function, the decision function (2) is transformed into a kernel expansion

$$f(\mathbf{x}) = \operatorname{sgn}\left(\sum_{i=1}^{N} \alpha_i k(\mathbf{x}_i, \mathbf{x}) - \rho\right)$$
(8)

(7)

$$L(\boldsymbol{\alpha}) = -\frac{1}{2} \sum_{i=1}^{N} \sum_{j=1}^{N} \alpha_i \alpha_j k(\mathbf{x}_i, \mathbf{x}_j). \tag{9}$$

Then, we obtain the dual problem

Minimize
$$\sum_{i=1}^{N} \sum_{j=1}^{N} \alpha_i \alpha_j k(\mathbf{x}_i, \mathbf{x}_j)$$
 (10a)

Subject to
$$0 \le \alpha_i \le \frac{1}{\nu N}$$
, $\forall i = 1 ... N$, $\sum_{i=1}^{N} \alpha_i = 1$ (10b)

[1] shown that at the optimum, the two inequality constraints (1b) became equalities if α_i and β_i are nonzero, which implies $0 < \alpha_i < \frac{1}{\nu N}$. Thus, the value of ρ can be recovered by exploiting that for any such α_i , the corresponding pattern \mathbf{x}_i satisfies

$$\rho = \langle \mathbf{w}, \Phi(\mathbf{x}_i) \rangle = \sum_{j=1}^{N} \alpha_j k(\mathbf{x}_j, \mathbf{x}_i)$$
 (11)

III. DESCRIPTION OF ANOMALY DETECTION PROCEDURE FOR WSNs

IV. ILLUSTRATIVE EXAMPLE

This section investigates the efficiency of anomaly detection algorithm over a real data set. The source code is freely available at https://github.com/trinhvv/wsn-ocsvm-dfn. All computation was performed on a platform with 2.6 GHz Intel(R) Core(TM) i7 and 16GB of RAM.
